standard of double strand coverage with a minimum of 2 clones and 2 reads with no ambiguities or 2 chemistries with a minimum of 2 clones and 3 reads with no ambiguities. If the sequence quality for a region does not meet this standard, it will be indicated in the annotation as Low Coverage.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         CLONE LENGTH: This sequence does not necessarily represent the entire insert of this clone. Overlapping regions of clones are only sequenced and submitted once, so the sequence for the remainder of the insert may be found in the record for the adjacent clones. Overlapping clones are noted at, the beginning and end of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               local mapping efforts.

Repeats are identified using RepeatMasker (A. Smit and P. Green, unpublished.) for Human and Mouse sequences.

Genes and Region of sequence similarity are identified by BLAST (Nuc. Acids Res. 25:3389-3402) similarity (expect < 1e-34) to the EST and cDNA sequences. Genes demonstrate at least two exons flanked by consensus splice sites that maintained sequence continuity across the splice junctions. Sequences that tare not identical matches are annotated as similar.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                QUALITY OF INDIVIDUAL BASES:This sequence meets stringent quality standards - estimated error rate less than 1 per 10,000 bases. Reports of lowest quality individual bases and measures of base quality are listed below. Description of the metrics can be found at URL: http://gc.bcm.tmc.edu:8088/quality.info/genbank.annotation.

             NOTE: This is a 'working draft' sequence. It currently consists of 16 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

Center clone name: 710_K_1
Sequencing vector: M13, M77815; 100% of reads
Sequencing vector: M13, M77815; 100% of reads
Chemistry: Dye-terminator Big Dye; 100% of reads
Assembly program: Phrap; version 0.960731
Consensus quality: 16564 bases at least Q40
Consensus quality: 166434 bases at least Q20
Consensus quality: 171495 bases at least Q20
Insert size: 176000; agarose-fp
Insert size: 17528; sum-of-contigs
Quality coverage: 4.4 in Q20 bases; sum-of-contigs
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  1382 1481: gap of 1381 bp in length 1382 1481: gap of 100 bp 1482 2059: contig of 578 bp in length 2060 2159: gap of 100 bp 2160 3484: contig of 1325 bp in length 3485 3584: gap of 100 bp 3582 5911: contig of 2227 bp in length 5812 5911: gap of 100 bp 5912 9908: contig of 3997 bp in length

Direct Submission Worley, K. JOURNAL AUTHORS

Submitted (28-MAR-2002) Human Genome Sequencing Center, Department of Molecular and Human Genetics, Baylor College of Medicine, One Baylor Plaza, Houston, TX 77030, USA Baylor Plaza, Houston, TX 77030, USA ON MAX 28, 2002 this sequence version replaced gi:19718609. INFORMATION: http://www.hgsc.bcm.tmc.edu/ or email gc-help@bcm.tmc.edu COMMENT

entire insert of this clone. Overlapping regions of clones are only sequenced and submitted once, so the sequence for the remainder of the insert may be found in the record for the adjacent clones. Overlapping clones are noted at the beginning and end of the CLONE LENGIH: This sequence does not necessarily represent the

local mapping efforts.

Repeats are identified using RepeatMasker (A. Smit and P. Green, unupublished.) for Human and Mouse sequences.

Genes and Region of sequence'similarity are identified by BLAST (Nuc. Acids Res. 25:3389-3402) similarity (expect < 1e-34) to the EST and cDNA sequences. Genes demonstrate at least two exons flanked by consensus splice sites that maintained sequence continuity across the splice junctions. Sequences that are not identical matches are annotated as similar.

standard of double strand coverage with a minimum of 2 clones and 2 reads with no ambiguities or 2 chemistries with a minimum of 2 clones and 3 reads with no ambiguities. If the sequence quality for a region does not meet this standard, it will be indicated in the annotation as Low Coverage. SEQUENCING READ COVERAGE: Sequencing is completed to a minimum

QUALITY OF INDIVIDUAL BASES:This sequence meets stringent quality standards - estimated error rate less than 1 per 10,000 bases. Reports of lowest quality individual bases and measures of base quality are listed below. Description of the metrics can be found at URL: http://gc.bcm.tmc.edu:8088/quality.info/genbank.annotation.

Streptococcus mutans ComC gene

(first entry)

01-JUL-2002

```
The invention relates to compound that competitively inhibits binding of competence signal peptide (CSP) to Streptococcus mutans histidine kinase (HK). Compounds of the invention are useful for treating or prophylaxis of caries or endocarditis. Vector comprising nucleic acid encoding S. mutans CSP is useful for producing recombinant host cell capable of expressing it. The recombinant host cell produced by the method is useful for expressing peptide in culture. S. mutans CSP DNA is useful for identifying nucleic acid molecules encoding CSP activated peptide. It is also useful as probes and in assays to identify entagonists or inhibitors of the peptides produced by the nucleic acid molecules. It is also useful for preparing vaccines for preventing or treating the above mentioned conditions. Antibodies against CSP activity are also useful for preventing caries. The antibodies are also useful secondarious are useful in assays for genetic competence. The present conditions are useful in assays for genetic competence. The present
                                                                                                                                                                                                                                                                                                                                 Novel compound that inhibits binding of competence signal peptide of Streptococcus mutans to S. mutans histidine kinase, useful for treating or preventing caries or endocarditis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 20
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   9

The invention relates to a compound that competitively inhibits the binding of competence signal peptide (CSP) to Streptococcus mutans histidine kinase (HK). Compounds of the invention are useful in accompliance of disrupting microbial biofilms involved in the treatment or prophlaxis of caries or endocarditis. They are useful for inhibiting or disrupting microbial biofilms involved in infections in man and animals and in biofouling of surfaces susceptible to microbial accumulation. They are also useful for treatment or prophylaxis of a disease, disorder or abnormal physical state caused by S. mutans. Pharmaceutical composition containing the compounds of the invention is useful for treating diseases caused by streptococcal confections. Polynucleotides encoding S. mutans CSP are useful as probes or in assays to identify antagonists or inhibitors of CSP peptides or or in assays to identify antagonists or inhibitors of CSP peptides or the useful for preparing antibodies, for vitro analysis of HK, CSP or Re activity or structure, and in assays for the identification and developments of compounds to inhibit and/or enhance polypeptide or providing protection against carles, to screen organisms or tissues containing CSP peptides from crude extracts, and to detect CSP or a similar peptide. The present sequence is S. mutans Comc gene encoding a similar peptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Novel compound that competitively inhibits binding of competence signal peptide to Streptococcus mutans histidine kinase, useful in treatment or prophylaxis of caries or endocarditis

The invention relates to compound that competitively inhibits binding of competence signal peptide (CSP) to Streptococcus mutans histidine kinase (HK). Compounds of the invention are useful for treating or prophylaxis of caries or endocardits. Vector comprising nucleic acid encoding S. mutans CSP is useful for producing recombinant host cell capable of expressing it. The recombinant host cell produced by the method is useful for expressing nucleic acid molecules encoding CSP DNA is useful for identifying nucleic acid molecules encoding CSP activated peptide. It is also useful as probes and in assays to identify antagonists or inhibitors of the peptides produced by the nucleic acid molecules. It is also useful for preparing vaccines for preventing or treating the above mentioned conditions. Antibodies are also useful for preventing caries. The antibodies are also useful in assays for genetic competence. The present sequence is S. mutans comCDE gene local region.
                                                                                                                                                                                                                                                 Novel compound that inhibits binding of competence signal peptide of Streptococcus mutans to S. mutans histidine kinase, useful for treating or preventing caries or endocarditis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             21 IleIleIleGlyGlySerGlySerLeuSerThrPhePheArgLeuPheAsnArgSerPhe 40

The invention relates to a compound that competitively inhibits the binding of competence signal peptide (CSP) to Streptococcus mutans histidine kinase (HK). Compounds of the invention are useful in mack and an imals and in biofouling of surfaces susceptible unfections in man and animals and in biofouling of surfaces susceptible to microbial accumulation. They are also useful for treatment or prophylaxis of a disease, disorder or abnormal physical state caused by S. mutans. Pharmaceutical composition containing the compounds of the invention is useful for treating diseases caused by streptococcal compositions. Polymucleotides encoding S. mutans CSP are useful as probes or in assays to identify antagonists or inhibitors of CSP peptides. They are also used for preparing vaccines. Polypeptides of the invention of succession of the invention are useful for preparing vaccines. Polypeptides of the invention of developments of compounds to inhibit and/or enhance polypeptide or providing protection against caries, to screen organisms or tissues containing CSP peptides from crude extracts, and to detect CSP or a similar peptide. The present sequence is S. mutans comcDE gene local
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Competence signal peptide; CSP; histidine kinase; HK; therapy; caries; endocarditis; immunopurification; antibacterial; antiinflammatory; genetic competence assay; vaccine; gene; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           /*tag= a

circumpetence signal peptide (CSD) to Streptococcus mutans histidine kinase (HK). Compounds of the invention are useful for treating or prophylaxis of caries or endocarditis. Vector comprising nucleic acid encoding S. mutans GSP is useful for producing recombinant host cell capable of expressing peptide for producing recombinant host cell capable of expressing peptide in culture. S. mutans GSP DNA is useful for expressing peptide in culture. S. mutans GSP DNA is useful for identifying nucleic acid molecules encoding CSP activated peptide. It is also useful as probes and in assays to identify or nucleic acid molecules. It is also useful for preparing vaccines for preventing or treating the above mentioned conditions. Antibodies against CSP activity are also useful for preventing caries. The antibodies against CSP activity are also useful for preventing caries. The antibodies are also useful for preventing caries. The antibodies are also useful for preventing caries. The antibodies are also useful for molecules are useful in assays for genetic competence. The present
                                                                                                                                                                                                                                                                                                              Novel compound that inhibits binding of competence signal peptide of Streptococcus mutans to S. mutans histidine Kinase, useful for treating or preventing caries or endocarditis
                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to compound that competitively inhibits binding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Streptococcus mutans competence signal peptide (CSP) DNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             63

The invention relates to a compound that competitively inhibits the binding of competence signal peptide (GSP) to Streptococcus mutans histories (HST). Compounds of tails of streptococcus mutans histories (HST). Compounds of tails or endocarditis. They are useful for inhibiting or disrupting microbial biofilms involved in infections in man and animals and in biofouning of surfaces susceptible to microbial accumulation. They are also useful for treatment or prophylaxis of a disease, disorder or abnormal physical state caused by S. mutans. Pharmaceutical composition containing the compounds of the invention is useful for treating diseases caused by streptococcal infections. Polynucleotides encoding S. mutans CSP are useful as probes or infections. Polynucleotides encoding S. mutans CSP are useful as probes or infections. Polynucleotides encoding S. mutans CSP are useful as probes or useful for preparing vaccines. Polypeptides of the invention are useful for preparing antibodies, for vitro analysis of HR, CSP or pertial for preparing antibodies, for vitro analysis of HR, CSP or peptide function directly. Antibodies of the invention are useful for preparing carlies, to screen organisms or tissues containing CSP peptides or CSP-like peptides, for immuno-purification of the containing CSP peptides from crude extracts.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Novel compound that competitively inhibits binding of competence signal peptide to Streptococcus mutans histidine kinase, useful in treatment or prophylaxis of caries or endocarditis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            9
                                                                                                                                                                                                                                                                                                  /product= "S. mutans competence signal peptide" /note= "CDS does not include start and stop codon"
Competence signal peptide; CSP; histidine kinase; HK; prophylaxis; therapy; caries; endocarditis; microbial biofilm; infection; gene; vaccine; antibacterial; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present sequence is S. mutans CSP DNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                0000

The present invention describes a computer readable medium which has the nucleotide sequences SEQ ID NO:1 to 391 (AAV52134 to AAV52524)

The nucleotide sequences SEQ ID NO:1 to 391 (AAV52134 to AAV52524)

CC dentical to SEQ ID NO: 1 to 391. The nucleotide sequence at least 958 identical to SEQ ID NO: 1 to 391. The nucleotide sequences depicted in SEQ ID NO: 1 to 391. The present invention also describes an streptococcus pneumoniae. The present invention also describes an isolated nucleic acid molecule encoding a homologue of any of the spenaments of the S.pneumoniae genome (SEQ ID NO:1 to 391) where the nucleic acid molecule is produced by a process comprising; (a) screening a qenomic DNA library using as a probe a target sequence defined by any cof the sequences in SEQ ID NO:1 to 391, identifying members of the incleic acid molecules from the hybridise to the target sequence and isolating the nucleic acid molecules from an organism, amplifying nucleic acid molecules from an organism, amplifying nucleic acid molecules from an organism, amplifying nucleic acid computer. The amplification and isolating the amplification and isolating the amplification and isolating the amplified sequences. The computer readable medium can be used in a computer-based system for identifying cradable medium can be used in a computer-based system for identifying cradable medium can be used in a diagnosis kits and assays, and parmaceutical compositions and vaccines for S. pneumoniae genome cyclines for S. pneumoniae.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Computer-readable medium with recorded Streptococcus pneumoniae polynucleotide sequences - useful in diagnostic kits and assays, and pharmaceutical compositions and vaccines for Streptococcus
                                                                                                                                                                                                                                                                                  Streptococcus pneumoniae; S. pneumoniae; genome; diagnosis; assay; computer readable medium; vaccine; pharmaceutical composition; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence 8411 BP; 2741 A; 1386 C; 1639 G; 2645 T; 0 other;

This invention describes a novel method for determining the degree of methylation of a particular cytosine in a motif 5'-cpG-3', present in a genomic sample of DNA. The sample is treated chemically to convert cytosine (C) but not methylated C, to uracil, then part of the genomic cytosine (C) but not methylated C to uracil, then part of the genomic DNA that contains the target C is amplified to form a labeled amplicon. The amplicon is hybridised to two classes, each with at least one member, of oligonucleotides and/or peptide-nucleic acid (PNA) oligomers and the degree of hybridisation to both classes is determined from the classes of oligomers. The degree of methylation is calculated. The method cis used: (i) for diagnosis and/or prognosis of side effects of therapeutic drugs and of a wide range of diseases, e.g. cancer, disorders of the central nervous, cardiovascular, gastrointestinal and respiratory systems etc., particularly by detecting mutations or single nucleotide polymorphisms (SNP'S); and (ii) for differentiation of call or tissue types and for investigating cell differentiation or callow allows the methylation status of many C residues to be determined simultaneously. The method for determining the degree of cytosine methylation described in

methylation of a particular cytosine in a motif 5'-CpG-3', present in a genomic sample of DNA. The sample is treated chemically to convert cytosine (C) but not methylated C, to uracil, then part of the genomic DNA that contains the target (is amplified to form a labeled amplicon. The amplicon is hybridised to two classes, each with at least one member, of oligomorclectides and/or peptide-nucleic acid (PNA) oligomers and the degree of hybridisation to both classes is determined from the label on the amplicon. From the ratio of labels hybridised to the two classes of oligomers, the degree of methylation is calculated. The method is used: (1) for diagnosis and/or prognosis of side effects of therapeutic drugs and of a wide range of diseases, e.g. cancer, disorders of the central nervous, cardiovascular, gastrointestinal and respiratory
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          useful

systems etc., particularly by detecting mutations or single nucleotide polymorphisms (SNP's); and (ii) for differentiation of cell or tissue types and for investigating cell differentiation. The method allows the methylation status of many C residues to be determined simultaneously. ABQ184107-ABQ54121 represent genomic DNA sequences used to illustrate the method for determining the degree of cytosine methylation described in the disclosure of the invention.

more

The invention relates to nucleic acid molecules (AAH87645-AAH88116) that correspond to all or part of a mRNA molecule expressed in plant oil aland cells, especially peppermint and plant oil glands that produce terpenoid essential oils and resins. The nucleic acids are useful for genetically mapping a plant genome for genes expressed in plant oil and to suppress (for example by antisense suppression) or enhance their expression (for example by genetically transforming a plant cell with a replicable expression vector that expresses one or more

of probes, primers and antisense sequences and for increasing/reducing expression levels of IPK in cells, particularly of essential oil plants, so as to increase flow through the isoprenoid biosynthesis pathway, resulting in increased production of e.g. pigments, vitamins and essential oils, also to increase resistance to pests and pathogens and to improve plant strength. Mutant forms of the IPK polynucleotide can be used to express forms of IPK that are resistant to IPK-targeted herbicides, and recombinant IPK can be used to screen for antibiotics, herbicides and antimalarial agents directed against IPK.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Monitoring differential expression of several genes in first Bacillus cell relative to expression of same genes in one or more second Bacillus cells, by using substrate containing Bacillus genomic

cheer in a first Bacillus cell relative to expression of the genes in cheer Bacillus cells, comprising hybridising labelled nucleic acid probes isolated from Bacillus cells to a substrate containing array of Bacillus cells. Comprising hybridising labelled nucleic acid probes solated from Bacillus cells to a substrate containing array of Bacillus genomic sequenced tags (65%), examining the array, and determining relative gene expression by an observed hybridisation reporter signal of a spot in the array. The method is useful for measuring the expression of genes in a first Bacillus cells. The method is useful for monitoring in one or more second Bacillus cells. The method is useful for monitoring genes, identifying possible functions of unknown open reading frames and monitoring gene copy number variation and stability. Monitoring changes in which Bacillus cells adapt to changes in culture conditions, in which Bacillus cells adapt to changes in culture conditions, contronmental stress or other physiological provocation. Extensive follow-up characterisation is unnecessary, when one spot on an array available. This sequence represents a genomic sequence information is white method of the invention.
                             invention describes a method of monitoring differential expression of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Note: The sequence data for this patent did not form part of the printer specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ftp.wipo.int/pub/published_pct_sequences.

(EPIG-) EPIGENOMICS AG.

```
This invention describes a novel method for determining the degree of methylation of a particular cytosine in a motif 5'~CpG-3', present in a genomic sample of DNA. The sample is treated chemically to convert cytosine (C) but not methylated C, to uracii, then part of the genomic DNA that contains the target C is amplified to form a labeled amplicon. The amplicon is hybridised to two classes, each with at least on the member, of oligonucleotides and/or peptide-nucleic acid (PNA) oligomers and the degree of hybridised to the classes; sedetermined from the classes of oligomers, the degree of methylation is calculated. The method is used: (1) for diagnosis and/or prognosis of side effects of the method is used: (1) for diagnosis and/or prognosis of side effects of the central nervous, cardiovascular, gastrointestinal and respiratory systems etc., particularly by detecting mutations or single nucleotide polymorphisms (SNE's); and (ii) for differentiation of cell or tissue types and for investigating cell differentiation of cell or tissue methylation status of many cresidues to be determined simultaneously.

Methylation status of many cresidues to be determined simultaneously.

Methylation status of many cresidues to be determined simultaneously.
                                                                                    Determining the degree of cytosine methylation in genomic DNA, useful for diagnosis and prognosis, comprises selective hybridization of amplicons from chemically treated DNA .
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           8885

Streptococcus polynucleotide SEQ ID NO 7949.

```
This invention describes a novel method for determining the degree of methylation of a particular cytosine in a motif 5'-CpG-3', present in a genomic sample of DNA. The sample is treated chemically to convert cytosine (C) but not methylated C, to uracil, then part of the genomic DNA that contains the target C is amplified to form a labeled amplicon. The amplicon is hybridised to two classes, each with at least one member, of oligonucleotides and/or peptide-nucleic acid (PNA) oligomers and the degree of hybridisation to both classes is determined from the member, of oligomers, the degree of methylation is calculated. The method is used: (1) for diagnosis and/or prognosis of side effects of the representic drugs and of a wide range of diseases, e.g. cancer, disorders of the central nervous, cardiovascular, gastrointestinal and respiratory systems etc., particularly by detecting mutations or single nucleotide polymorphisms (SNP s); and (1) for differentiation or call or tissue types and for investigating cell differentiation. The method allows the method for determining the degree of cytosine methylation described in method for determining the degree of cytosine methylation described in the invention.
                                                                                                                                                                                                                                                      Determining the degree of cytosine methylation in genomic DNA, useful for diagnosis and prognosis, comprises selective hybridization of

The invention relates to a protein (ABP25413-ABP30895) from group B streptococcus/GBS (Streptococcus agalactiae) or group A streptococcus/GBS (Streptococcus agalactiae) or group A streptococcus/GBS (Streptococcus progenes), comprising one of 5481 sequences (S1), given in the specification. The proteins have antibacterial and antihiflammatory activity. (I), nucleic acids encoding (I), ABM50604-ABM71526 and antibodies that bind (I) are used in the manufacture of medicaments for the treatment or prevention of infection or disease caused by Streptococcus bacteria, particularly S. agalacties and S. pyrogenes. Nucleic acids encoding (I) are used to detect Streptococcus in a biological sample. (I) is used to detect Streptococcus in a biological sample or diagnostic acid encoding (I), may be used as a vaccine or diagnostic composition. The disease caused by Streptococcus that is prevented or treated may be meningitis. Nucleic acid encoding (I) may be used in gene therapy. Antibodies to (I) are used for affility claim may be used in gene therapy, antibodies to (I) are used for affility
                                 Streptococcus, GAS; GBS; group B streptococcus, Streptococcus agalactiae; group A streptococcus; Streptococcus pyogenes; antibacterial; gene; antiinflammatory; infection; vaccine; meningitis; gene therapy; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New Streptococcus protein for the treatment or prevention of infectic
or disease caused by Streptococcus bacteria, such as meningitis, and
for detecting a compound that binds to the protein -

Sequence 12, Application US/08288065A
Patent No. 5961982
GENERAL INFORMATION:
APPLICANT: Cochran, Mark D
APPLICANT: Macdonald, Richard D
TITLE OF INVENTION: Recombinant Herpesvirus of Turkeys S-
TITLE OF INVENTION: HVT-050 and Uses Thereof
APPLICANT: Cochran Ph.D, Mark D
APPLICANT: Macdonald Ph.D., Richard D
TITLE OF INVENTION: Recombinant Herpesvirus of Turkeys
TITLE OF INVENTION: and Uses Thereof
NUMBER OF SEQUENCES: 47
CORRESPONDENCE ADDRESS:
ADDRESSEE: John P. White
STREET: 30 ROCKEfeller Plaza
